Air Sampling And Analysis

Air testing for specific chemical compounds is an investigative tool used to characterize the nature and extent of contaminants in air and to determine whether contaminant sources affect indoor air quality. The purpose of this document is to outline the recommended procedure for testing indoor air for volatile chemicals. This document provides guidance for preparing sampling locations and collecting samples for laboratory analysis to ensure the integrity of the test results and allow for ...

Herein, an overview is given on how these exposures can be categorized and measured analytically, describing in particular strategic and technical sampling, as well as the possibilities of analysis. We further emphasize active sampling procedures, for which workplace air is drawn onto a collection medium using especially designed sampling pumps.

AIR SAMPLING Air pollution sampling : Related to analysis of pollutants in a given volume of air. Air sampling: Capturing the contaminant from a known volume of air, measuring the amount of contaminant captured, and expressing it as a concentration The air is passed through a filter medium (normally a paper for solid & liquid contaminants and a sorbent for gases). The volume of air is measured against the amount of contaminant captured.

The objective of ambient air sampling is determining the quality of ambient air as it relates to the presence and concentration of substances regarded as pollutants. The specialized devices and techniques for carrying out this task have been developed over half a century. Obtaining representative samples is a major objective of the work plan.
