When the bases are different and the exponents of a and b are the same, we can multiply a and b first: $a^n \cdot b^n = (a \cdot b)^n$.

Example: $3^2 \cdot 4^2 = (3 \cdot 4)^2 = 12^2 = 12 \cdot 12 = 144$.

When the bases and the exponents are different we have to calculate each exponent and then multiply: $a^n \cdot b^m$. Example: $3^2 \cdot 4^3 = 9 \cdot 64 = 576$.

**Chapter 3 Powers
and Exponents**

Exponentiation is a mathematical operation involving two numbers, the base x and the exponent a . When a is a positive integer, exponentiation corresponds to repeated multiplication of the base. For example, if the base is $x = 2$ and the exponent $a = 3$, it is written as $x^a = 2^3$.
